
a
b
Quality benefit τ
Cost scale ρ
$\tau = 1$
$\tau = 0.5$
$\tau = 0.25$
$\tau \leq 0$: baseline optimal
Q^* at $C = 10^{19}$ FLOPs
Q_0
Transition budget (FLOPs)
Endpoint increment $\rho\,[g(1) - g(Q_0)]$ (10^9 FLOPs/token)
Exponential: leaves Q_0
Exponential: reaches $\bar{Q}$
Power: leaves Q_0
Power: reaches $\bar{Q}$
Logarithmic: jump
slope $(\alpha + \beta)/\beta = 2.214$
